

Problem Statement – SmartPick AI

Online shoppers often spend a significant amount of time searching for suitable products across multiple e-commerce platforms. Product searches using only text may not always provide accurate or personalized results, especially when users want to search using images, voice, or videos. Comparing products, prices, and ratings from different shopping platforms manually is also difficult and time-consuming.

To address this problem, a multimodal Machine Learning-based shopping assistant that allows users to search and compare products using text, image, audio, and video inputs. The system analyzes user inputs, identifies product features, and recommends similar products from various e-commerce platforms such as Amazon, Flipkart, and Myntra. The system aims to provide faster product discovery, personalized recommendations, and efficient product comparison for users.
